SUMMARY

Backend-focused Computer Applications undergraduate building production systems in Node.js, TypeScript, and NestJS. Currently architecting a full-stack government application portal as a backend intern at EVON; independently audited and resolved critical production blockers — including a cross-platform deployment failure, broken authentication middleware, and an OAuth token leak — in a deployed personal backend project.

EDUCATION

Bachelor of Computer Applications (BCA)

Expected 2027

COER University, Roorkee, Uttarakhand | CGPA: [X.XX / 10] | Currently in 4th Semester

Relevant Coursework: Data Structures & Algorithms, DBMS, Operating Systems, OOP, Design and Analysis of Algorithms

EXPERIENCE

Backend Developer Intern — EVON

[Month Year] – Present

- Architecting and building USAME, a full-stack online government application portal for the Uttarakhand State Minority Education Authority, from system design through implementation
- Developing backend services using NestJS, Prisma ORM, and TypeScript, applying modular, type-safe architecture for a multi-stakeholder government workflow system
- Translating department requirements into technical specifications, including data models, API contracts, and role-based access control design

TECHNICAL PROJECTS

YouTube Clone Backend — VidTube

Node.js, Express.js, MongoDB, JWT, Render

- Architected a RESTful API supporting authentication, video upload workflows, and user interactions (likes, comments, subscriptions) backed by MongoDB/Mongoose schemas
- Conducted a full security and reliability audit of the deployed system; identified and fixed a critical cross-platform deployment failure caused by case-sensitive import paths that passed on Windows but broke the Linux production build
- Diagnosed and repaired authentication middleware left non-functional after a cookie-based auth migration, restoring access control across all protected routes
- Remediated an OAuth token leak via URL query parameters, closed an authorization bypass permitting unauthorized access to private videos, and resolved TOCTOU race conditions on toggle endpoints using atomic database operations
- Deployed and maintains the application in production on Render

AI Gesture Recognition System — Hand-Tracker

Python, MediaPipe, TensorFlow/Keras, LSTM

- Built a real-time hand-gesture recognition system using MediaPipe for hand-landmark detection and an LSTM network for temporal gesture classification
- Designed a training pipeline to classify sequential hand movements and trigger corresponding visual effects in real time, applying computer vision and sequence modeling outside primary backend specialization

HACKATHONS & COMMUNITY INVOLVEMENT

Frontend Developer — National Level Hackathon, COER University

- Collaborated with a cross-functional team under a fixed deadline to build and deploy a dynamic travel application
- Led frontend development, focusing on responsive UI design and end-to-end user experience

Active Member — TRAIC Community

- Participate in technical discussions, peer learning, and community-driven engineering initiatives

TECHNICAL SKILLS

Languages: JavaScript, TypeScript, Python | **Backend:** Node.js, Express.js, NestJS

Databases & ORMs: MongoDB, Mongoose, PostgreSQL, Prisma ORM

Core Concepts: RESTful API Design, MVC/Modular Architecture, JWT & OAuth Authentication, Database Modeling, Concurrency & Race Condition Handling

Tools: Git, GitHub, Postman, Render
